Java

```java
class Solution {
    public List<String> validateCoupons(String[] code, String[] businessLine, boolean[] isActive) {

    }
}
```

JavaScript

```javascript
/**
 * @param {string[]} code
 * @param {string[]} businessLine
 * @param {boolean[]} isActive
 * @return {string[]}
 */
var validateCoupons = function(code, businessLine, isActive) {

};
```

TypeScript

```typescript
function validateCoupons(code: string[], businessLine: string[], isActive: boolean[]): string[] {

};
```

C++

```cpp
class Solution {
```

```cpp
public:
    vector<string> validateCoupons(vector<string>& code, vector<string>& businessLine, vector<bool>& isActive) {

    }
};
```

C#

```csharp
public class Solution {
    public IList<string> ValidateCoupons(string[] code, string[] businessLine, bool[] isActive) {

    }
}
```

Kotlin

```kotlin
class Solution {
    fun validateCoupons(code: Array<String>, businessLine: Array<String>, isActive: BooleanArray): List<String> {

    }
}
```

Go

```go
func validateCoupons(code []string, businessLine []string, isActive []bool) []string {

}
```
